Media Storage & Review Tools

Comparing Frame.io, Shade, and LucidLink — and how LucidLink could pair with the existing Google Drive workflow.

Media Storage & Review Tools — Options

Attribute	Frame.io	Shade	LucidLink
What it is	Client review & delivery platform (current tool)	Media storage + search platform	Cloud-mounted shared storage for editors
Core strength	Frame-accurate client commenting via "Submit a Revision" flow through ClickUp	Footage storage/search across old projects	Editors working off shared storage without downloads
Storage	Included, tiered by plan	Included, tiered by plan	Bring-your-own (S3, Drive, etc.) via mounted filesystem
Client review	Yes — deepest strength	Partially	No — complements review tools, doesn't replace them
Pricing	Free / \$15 / \$25 per member/mo + custom Enterprise	~\$20/seat/mo or custom	\$7–\$32/seat/mo, custom above
Replaces Drive?	No	Partially	No — complements it

Where Each One Fits

Frame.io (keep as-is): doing its job — its deepest strength is frame-accurate client commenting via the "Submit a Revision" flow through ClickUp.

Shade: only worth it if footage storage/search across old projects becomes the bottleneck, not review — it's a bigger swap trying to replace Frame.io + Drive + a media asset manager all at once.

LucidLink: worth watching — solves the editors-working-off-shared-storage problem, not client review. Cheaper entry (\$7/seat vs. Frame.io's \$15) and doesn't compete with anything currently in place.

How LucidLink Pairs With Google Drive

LucidLink Connect (2026) mounts an existing Google Drive into a LucidLink filesystem — no migration or duplicate copies required. Editors would work from the LucidLink-mounted drive during production, while client-facing folders and deliverables stay in Drive unchanged (current portal Drive links are unaffected). LucidLink can also back up/sync Drive content if wanted.

Future NAS/SAN Build

LucidLink is explicitly built for hybrid on-prem + cloud setups (comparable to Avid NEXIS/SNS EVO). Local edit bays would get full local-network speed off a NAS/SAN, while LucidLink handles remote access to the same media pool without VPN or manual transfers. Two practical options: run the two side by side, or point LucidLink at the NAS/SAN as its S3-compatible backing store. Building a NAS/SAN first doesn't lock out a later LucidLink decision.
