Hub Automation Addendum

Sales, Payments, Reporting & Offboarding — what's now automated in the Hub,
and where the documented flow has drifted

Hub Automation Addendum

Addendum to Complete System Flows & Process Map. Covers what's now automated in the Hub across sales, payments, reporting, and offboarding, and where the previously documented flow had drifted from what's actually built.

1. Sales → Delivery Handoff

The documented onboarding flow assumes an account manager is already known by the time the intake form goes out, and that a formal “Sales → Delivery Handoff Form” gets submitted in ClickUp on Day 2. In the Hub, neither existed: the account manager field on a client's portal config was a manual free-text entry nobody was prompted to fill in, no handoff was ever logged, and nobody was notified when a deal closed.

Updated flow:

1. Deal reaches Closed Won on the Hub's Sales Pipeline Board. This save also updates the matching ClickUp task's status directly (existing Hub → ClickUp sync) — ClickUp stays the record of truth, no separate step needed there.
 2. Hub fires automatically: logs “Deal marked Closed Won” to the admin activity log, and pushes an in-Hub notification: “{Client} marked Closed Won — create their Hub client profile if needed, then complete the Sales → Delivery Handoff in Kickoff Prep & Deck.”
 3. Whoever owns that notification opens Kickoff Prep & Deck → Sales → Delivery Handoff, selects the Account Manager from a Team Roster dropdown (not free text), and adds handoff notes.
 4. Clicks “Complete Handoff & Notify Account Manager.” Sets the client's portal config, writes a `deliveryHandoff` record, logs the handoff, and emails the assigned account manager directly.
- Still manual, on purpose: who the account manager should be (no rule exists for that), and creating the Hub client profile itself if it doesn't exist yet.
 - Lives in: `kickoff-prep/index.html` + `js/app.js`, `sales-pipeline-board/js/app.js` (`notifyDealWon`), `app.js` root (`emailAccountManagerHandoffNotification`).

2. Payment Flow — Subscription Canceled Alert

The documented Payment Flow calls for “services suspended | Account manager notified” once all Stripe retries on a failed payment are exhausted. Previously only the first failed-payment attempt triggered an alert, and only to the shared `invoices@` inbox — a subscription actually canceling after every retry failed produced no alert to anyone.

- Now: when Stripe sends `customer.subscription.deleted`, the Worker looks up that specific client's account manager (from their portal config) and emails them directly — not just the shared alias — noting the subscription was canceled and that services should be paused until it's resolved.

- Lives in: `_worker.js`, `applyStripeEventToContractInvoices` (`customer.subscription.deleted` branch).

3. Monthly Reporting Flow — Overdue Reminder

The documented flow expects a report delivered to every client by the 5th of each month. Nothing previously flagged a client who fell through the cracks — Monthly Report Archive just stored whatever got uploaded, with no due-date awareness.

- Now: Agency Health Dashboard (and its weekly Cron-triggered email mirror) both flag any client who has at least one report on file but hasn't had a new one added in 35+ days.

- Deliberately conservative: this does not flag brand-new clients who haven't reached their first report cycle yet — there's no "client since" date tracked anywhere in the Hub to tell that apart from a genuinely overdue client, so it only watches for reports going stale, not a missing first report.

- Lives in: `agency-health-dashboard/js/app.js`, `_worker.js` (`buildHealthDigestRows`), `app.js` root (`runReportOverdueNudgeCheck`).

4. Offboarding Flow — Portal Deactivation & Re-Engagement

The documented Offboarding Flow includes "Hub portal deactivated — client can no longer log in" and "90-day re-engagement reminder set." The Offboarding Checklist tool existed, but completing every item did nothing beyond updating a percentage — no portal deactivation, no access-removal logging, no re-engagement reminder anywhere in the Hub.

- Now: the moment the checklist first hits 100%, the Hub deactivates that client's portal (they see "Portal No Longer Active" instead of their dashboard) and logs it to the admin activity log. A "Reactivate Portal" button is available if that was triggered by mistake.

- A reminder now fires 90 days after an offboarding completes, prompting a re-engagement outreach — re-nudging every 30 days after that until acted on.

- Note: this is a UI-level gate, not a data-access revocation — the underlying client record is still fetchable with the token per `firestore.rules`. Worth a follow-up if the goal is to fully cut off data access rather than just stop the portal from rendering.

- Lives in: `client-offboarding-checklist/js/app.js` (`completeOffboarding`, `reactivatePortal`), `portal/js/app.js` (the disabled check in `init()`), `app.js` root (`runReengagementNudgeCheck`).

Doc Corrections Worth Making

- Section 2 / Section 9 (Zap 1): the documented flow has Zap 1 notify an account manager the moment the intake form is submitted — but nothing in the process actually decides who that account manager is before that point. Item 1 above resolves this by prompting a human to assign the AM the moment a deal is marked Closed Won, before any notification goes out. Recommend describing the Hub-driven handoff here instead of, or alongside, Zap 1.

- Section 10 (Tool Map): Discovery Call Script and Pre-Qualifier are both listed as "(coming)." Both have been live in the Hub for some time now — recommend dropping the tag.

UPDATE — SEPTEMBER 2026

HubSpot Sync Added to the Closed-Won Flow

The Closed Won automation described on the previous pages now writes to HubSpot as well as ClickUp.

Step 1 — Deal reaches Closed Won

Revision note: This save now also creates/updates the matching HubSpot Deal (with linked Contact, resolved owner, and a first-touch Note), in parallel with the existing Hub → ClickUp sync. Correction to the earlier framing: the Hub itself is the authoritative record — ClickUp and HubSpot are both mirrors fed from it, not sources of truth in their own right.
